Problem of the Day

The patterns in the number sequence 3, 6, 9, 12 can be described by looking at how the pattern grows (by adding three each time) and by a function rule: y = 3x where x = first, second, third. . .term.

Consider this sequence: 2, 6, 12, 20, 30. . .

What is the 20th term. Describe how you found it.
